

Minutes of Meeting

Global Mobility Fabric Workshop

Purpose of the Meeting

To bring together two ongoing threads — NFH/Beckn's global fabric strategy and WRI's mobility collaboration work — and convert them into a concrete, outcome-oriented program. The ambition: use the Beckn Fabric's global infrastructure to unlock open mobility networks in multiple cities simultaneously, backed by a compelling narrative and a structured implementation plan.

The spreadsheet used for brainstorming can be viewed [here](#)

Key Decisions Made

1. The program framing shifts from concept to offering. The group agreed to stop leading with "open networks" as an abstraction. The pitch to cities must lead with specific, tangible offerings — what a city gets, what problem it solves, what it costs — and explain the open network architecture only when cities ask how it works. As Pramod put it: go with the offering, not the ideology.

2. Target: two cities, 200,000 transactions per day by February 2027. This is the headline goal the entire program is organized around. Two cities across different geographies (e.g. one in Latin America, one in Europe/US), with a fully transactional network running at scale within six months of signing.

3. Three priority use cases shortlisted (by group vote):

- **Multimodal MaaS** — 7 votes — the anchor use case
- **Driver Credentials & Employment Network** — 5 votes
- **Parking** — 4 votes
- **EV Charging** — 4 votes (likely bundled with parking)

Working capital financing, subsidies/vouchers, green credits, and congestion pricing were discussed as secondary or bundling opportunities rather than primary entry points.

4. Two on-fabric value-added offerings introduced:

- **Pincer** — a cryptographic guarantee mechanism that can be attached to any transaction on the network (ride-hailing was the demo case: zero-cancellation)

guarantee backed by escrow). Not a platform feature — a network-level offering any operator can subscribe to.

- **Vouch** — purpose-specific vouchers enabling employers, governments, or programmes to fund specific mobility behaviours (green transit, EV use, etc.) with programmable, non-fungible value.

Both are Layer 2 offerings on top of the Fabric — not part of the core protocol, but attachable services that add reliability and financing capability to any use case.

5. The Global Open Network Alliance will be formally launched. NFH would like WRI to also join and have a mobility vertical.

6. Program name under consideration: "Urban Web" or "Cities for Humanity" or similar. Final name to be confirmed. A dedicated website to be made with mock demos.

Key Discussions

On the Fabric

Pramod clarified: the Fabric is a fully peer-to-peer decentralised infrastructure supporting tokenisation and any form of value exchange. Beckn is integral to it. The Fabric provides discovery, trust, negotiation, and contracting — not just open data. Transactions are peer-to-peer; no central platform intermediates. NFH offices are now live in Switzerland, US, India, and Singapore — making global deployment structurally possible for the first time.

The distinction from platforms like Transport for London's open data: the Fabric enables contracting, agentic AI participation, and programmable value exchange — not just data publication.

On Use Cases

Multimodal MaaS was the clear consensus anchor. The framing proposed: "Why shouldn't MaaS be a network?" — positioning open network MaaS as an alternative to proprietary MaaS platforms, with Curitiba (already planning a MaaS pilot) as the natural first city.

Parking generated the most detailed discussion. Key insights:

- Cities struggle with demand assessment, tariff-setting, and leakage in collection
- Off-street parking operators are moving away from Fastag due to T+2 settlement delays and perverse incentives
- On-street parking is largely undigitised in India; more mature in Amsterdam/Europe
- The reframe proposed: make parking a consumer convenience narrative, not a government enforcement narrative — discoverability, availability, transparent pricing, easy payment
- Parking and EV charging should be bundled, not treated separately

Rajit:

1. **Driver Credentials & Employment Network:** Active work already underway — collaboration with cab and bus operator confederations. 22+ lakh skilled drivers needed in India. The use case: verifiable digital credentials for drivers (licence, skills, history) enabling discovery across operators, and unlocking better job opportunities beyond their current geography. Data is consent-based; drivers control their own credential wallet.
2. **Working Capital Finance:** Currently piloting with ~25 operators, targeting July launch. Mobility intermediaries (aggregators) are helping financing institutions service small working capital loans (₹3-4 lakh) by bringing operator transaction books onto the network — machine-readable, countersigned, verifiable. The Fabric enables tokenised collateral and direct benefit transfers.

Sujith (Examples of on-fabric services):

1. **Pincer (Guarantee System):** Demonstrated via dummy demo. A provider locks the ride cost in escrow. If they cancel within the window, they forfeit part of the escrow, which funds a backstop provider who completes the ride. Consumer pays the original fare; reliability is guaranteed at the network level, not the platform level. Applicable beyond ride-hailing — ambulances, airport drops, any fulfilment guarantee. Scalability comes from the pooled supply across the open network.
2. **Vouch (Purpose-Bound Vouchers):** Employers can fund employees' green transit choices; governments can subsidise specific mobility behaviours; programmes can issue non-fungible, purpose-specific credits. Particularly relevant for Global North cities with sustainability mandates and Scope 3 reporting requirements.

Green Credits: Flagged as a high-potential but longer-term use case — linking verified mobility behaviour (switching to EV, reducing car trips) to tradeable environmental credits, potentially integrating health insurance companies. Needs further research before it becomes a primary offering.

On City Strategy

Latin America was confirmed as the primary geography for the first pilot. Curitiba is the strongest candidate — engaged local government, MaaS pilot already planned, Hipervisor Urbano underway, EV transition commitment. WRI has direct relationships with IPPUC (urban planning) and URBS (transport authority). Mexico City was noted as another strong candidate given WRI's office there and relationships with the city's leadership.

Global North cities discussed: Amsterdam (both WRI and Beckn have presence; 9292 service expressed interest in connecting with Namma Yatri), Germany, Australia, Japan (Hamamatsu specifically mentioned), South Korea, Singapore.

Pramod's strong recommendation: avoid framing this as a "Global South DPI" story — it limits credibility and adoption in the Global North. The narrative must work in Amsterdam and Curitiba simultaneously.

On governance structure by geography: Latin America operates on a mayoral system — decisions are faster if you have the Mayor's office. India and Africa are more bureaucratic. US/EU/LatAm/Southeast Asia were identified as having quicker implementation pathways.

City engagement model: Cities should not be sold a product — they should be offered a programme with skin in the game.

On AI and Future Framing

Pramod's strongest intervention: the team consistently misses the AI angle. Gen Alpha and Gen Z will experience city mobility through natural language and agentic interfaces — not apps. The position paper and city pitches must engage with what urban mobility looks like in 3-5 years with AI disruption, not just solve yesterday's problems. Cities that have heard parking and MaaS a hundred times need to hear something they haven't.

Agreed Deliverables & Timeline

By Friday, March 27

- [] Bundle use cases - supply side and demand side
- [] Website domain registered and running (working title: "Urban Web" or equivalent)
- [] Four agentic, clickable mock demos hosted on the site
- [] Website content — value proposition articulated without Beckn/open network jargon; use case descriptions; city "shopping cart" structure
- [] Draft cold email
- [] List of 10-15 target cities with contacts for each
- [] Call for Participation page on the website
- [] Draft Urban Web Charter (scope, timeline, targets)
- [] All assets should be in a shared NFH-WRI Google Drive folder

By Thursday, April 3

- [] Launch: website live, cold emails sent to all target cities
- [] Draft investor pitch (5-10 pages)

April 13-17

- [] Funnel review — assess responses from cold outreach, re-strategise

April 24 onwards

- [] Repeat outreach cycle until minimum two cities confirm interest

By May 1

- ☐ Two interested cities confirmed

May 1 – June 1

- ☐ Proposals submitted and MOUs signed for City 1

June 1 – July 1

- ☐ Proposals submitted and MOUs signed for City 2

July 1 – October 1 (Cycle 1)

- ☐ Three 20-day sprints
- ☐ Deploy fully transactional network
- ☐ Target: **200 transactions per day**

October 1, 2026 – February 1, 2027 (Cycle 2)

- ☐ Scale to **200,000 transactions per day**
